youtube-spam-v4

April 23, 2019

V4: + LSTM uses the Tokenizert.fit_on_texts(data) then Tokenizert.texts_to_sequences(data) to do the preprocessing + Other models uses the CountVectorizer to do the the preprocessing

In [1]:
```
import numpy as np
import pandas as pd
import matplotlib as mpl
import matplotlib.pyplot as plt
import seaborn as sns
import string
from sklearn.feature_extraction.text import CountVectorizer
# from sklearn.feature_extraction.text import TfidfVectorizer
from sklearn.model_selection import train_test_split
from nltk.corpus import stopwords
from sklearn.preprocessing import LabelEncoder
%matplotlib inline
```

In [2]:
```
# Dataset from https://archive.ics.uci.edu/ml/datasets/YouTube+Spam+Collection#
df1 = pd.read_csv("../data/UCI-YouTube-Spam-Collection/Youtube01-Psy.csv")
```

In [3]:
```
df1.head()
```

0.0.1 Text processing and vectorizing our meddages

Let's create new data frame. We'll need a copy later on

```
In [18]: text_feat = ytb['content'].copy()
```

Now define our tex precessing function. It will remove any punctuation and stopwords aswell.

```
In [19]: # def text_process(text):

         #     text = text.translate(str.maketrans('', '', string.punctuation))
         #     text = [word for word in text.split() if word.lower() not in stopwords.words('e

         #     return " ".join(text)
```

```
In [20]: # text_feat = text_feat.apply(text_process)
```

```
In [21]: vectorizer = CountVectorizer()
```

```
In [22]: features = vectorizer.fit_transform(text_feat)
```

```
In [23]: labels = LabelEncoder().fit_transform(ytb['label'])
         labels = labels.reshape(-1,1)
```

```
In [24]: text_feat.shape
```

```
Out[24]: (1956,)
```

```
In [25]: features.shape
```

```
Out[25]: (1956, 4454)
```

0.0.2 Classifiers and predictions

First of all let's split our features to test and train set

Now let's import bunch of classifiers, initialize them and make a dictionary to itereate through

```
In [26]: from sklearn.linear_model import LogisticRegression
         from sklearn.svm import SVC
         from sklearn.naive_bayes import MultinomialNB
         from sklearn.tree import DecisionTreeClassifier
         from sklearn.neighbors import KNeighborsClassifier
         from sklearn.ensemble import RandomForestClassifier
         from sklearn.ensemble import AdaBoostClassifier
         from sklearn.ensemble import BaggingClassifier
         from sklearn.ensemble import ExtraTreesClassifier
         from sklearn.metrics import precision_score, recall_score, accuracy_score, f1_score
```

```
/Users/alex/anaconda/envs/gc/lib/python3.6/site-packages/sklearn/ensemble/weight_boosting.py:29
  from numpy.core.umath_tests import inner1d
```

```
In [27]: svc = SVC(kernel='sigmoid', gamma=1.0)
         knc = KNeighborsClassifier()
         mnb = MultinomialNB()
         dtc = DecisionTreeClassifier(random_state=111)
         lrc = LogisticRegression(solver='liblinear', penalty='l1')
         rfc = RandomForestClassifier(n_estimators=500, random_state=111)
         abc = AdaBoostClassifier(random_state=111)
         bc = BaggingClassifier(random_state=111)
         etc = ExtraTreesClassifier(random_state=111)
```

```
In [28]: features_train, features_test, labels_train, labels_test = train_test_split(features,
```

```
In [29]: clfs = {'SVC' : svc,'KN' : knc, 'NB': mnb, 'DT': dtc, 'LR': lrc, 'RF': rfc, 'AdaBoost
```

Let's make functions to fit our classifiers and make predictions

```
In [30]: def train_classifier(clf, feature_train, labels_train):
             clf.fit(feature_train, labels_train)
```

```
In [31]: def predict_labels(clf, features):
             return (clf.predict(features))
```

Now iterate through classifiers and save the results

```
In [32]: import time
```

```
In [33]: pred_scores = []
         for k,v in clfs.items():
             since = time.time()
```

```
            train_classifier(v, features_train, labels_train)
            time_elapsed = time.time() - since

            pred = predict_labels(v,features_test)
            pred_scores.append((k, [precision_score(labels_test,pred), recall_score(labels_tes
```

```
/Users/alex/anaconda/envs/gc/lib/python3.6/site-packages/sklearn/utils/validation.py:578: DataC
  y = column_or_1d(y, warn=True)
/Users/alex/anaconda/envs/gc/lib/python3.6/site-packages/ipykernel/__main__.py:2: DataConversio

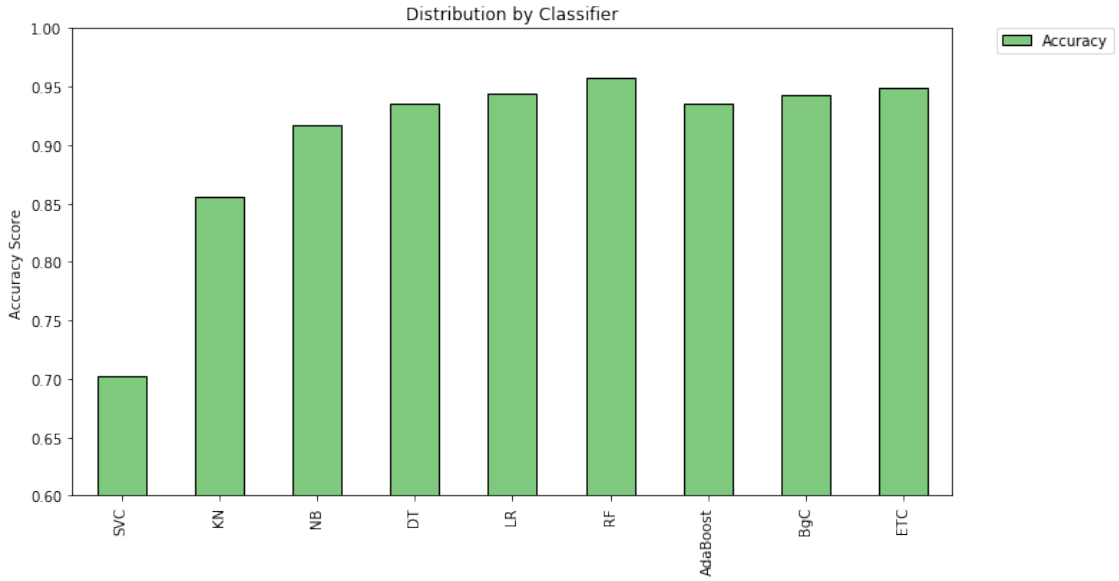
         plt.savefig("../img/ytb-acc-basemodel-v4.eps")
         plt.show()
```



0.0.3 RNN

Define the RNN structure.

```
In [38]: from keras.models import Model
         from keras.layers import LSTM, Activation, Dense, Dropout, Input, Embedding
         from keras.optimizers import RMSprop
         from keras.preprocessing.text import Tokenizer
         from keras.preprocessing import sequence
         from keras.utils import to_categorical
         from keras.callbacks import EarlyStopping
         from keras.callbacks import Callback
```

```
Using TensorFlow backend.
```

0.0.4 Process the data

- Tokenize the data and convert the text to sequences.
- Add padding to ensure that all the sequences have the same shape.
- There are many ways of taking the *max_len* and here an arbitrary length of 500 is chosen. (From the Fig, almost all the sentences have the length < 500)

```
In [39]: features_lstm = text_feat
         labels_lstm = labels
```

```
In [40]: max_words = 1000
         max_len = 500 # n_features
         tok = Tokenizer(num_words=max_words)
```

```
        tok.fit_on_texts(features_lstm)
        sequences = tok.texts_to_sequences(features_lstm)
        features_lstm = sequence.pad_sequences(sequences,maxlen=max_len)
```

```
In [41]: features_lstm.shape
```

```
Out[41]: (1956, 500)
```

```
In [42]: labels_lstm.shape
```

```
Out[42]: (1956, 1)
```

```
In [43]: features_lstm_train, features_lstm_test, labels_lstm_train, labels_lstm_test = train_t
```

```
In [44]: def RNN():
             inputs = Input(name='inputs',shape=[max_len])
             layer = Embedding(max_words,50,input_length=max_len)(inputs)
             layer = LSTM(100)(layer)
             layer = Dense(256,name='FC1')(layer)
             layer = Activation('relu')(layer)
             layer = Dropout(0.1)(layer)
             layer = Dense(1,name='out_layer')(layer)
             layer = Activation('sigmoid')(layer)
             model = Model(inputs=inputs,outputs=layer)
             return model
```

```
In [45]: model = RNN()
         model.summary()
         model.compile(loss='binary_crossentropy',optimizer=RMSprop(),metrics=['accuracy'])
```
